Multi Directional Forklift

Used Side Loader Forklift Huntington Beach - Side loader forklifts are ideal for lifting long and heavy materials in narrow locations such as warehouse aisles, loading docks, lumber yards, etc. Side loaders have earned their name due to their design and the way they transport, load and unload items. Benefits of Side Loader Forklifts v Standard Forklifts Forklifts which operate on the standard counterbalance system may become unstable when loading, transporting or unloading heavy, long loads. The side loader is capable of transporting dangerous loads such as piping and timber. Having the load face the direction of travel ensures that timber and steel can be easier to maneuver. They also offer the advantage of providing the driver of the forklift with an unobstructed view, which is otherwise at least somewhat or greatly impeded by the tines and load carried at the front on a standard forklift. Since the loads are transported along the side of the forklift instead of across the front, the side loader can travel easier through narrow aisles and doorways. The load may have to be lowered or raised to get past obstacles that can increase the chances of destabilizing and cause dangerous tip-overs. Side loaders eliminate the need for much of that maneuvering. This means warehouse operations can manage in much smaller spaces with fewer modifications while also operating in a safer manner. Many models can lift up to 12K lbs. while traveling at speeds higher than 5 miles an hour. There may be the ability to have travel speeds programmed. This feature allows the operator to match speed to a specific application. Types of Side Loader Forklifts Class 2 - Electric Motor Narrow Aisle Trucks Side loader forklifts often fall under the Class 2 - Electric Motor Narrow Aisle Trucks classification. This class captures the forklifts that operate in narrow aisles with electrically sourced power. The side loader is useful for handling long and narrow loads in similar locations including lumber, carpet and laminate. These machines are additionally used for rack storage and feeding machine tools. The narrow aisle set up is common in warehouses because it allows for the maximum possible use of a storage area which helps to save on costly square footage as well as travel time between material and loading and unloading areas. Class 2 side loaders take up less space compared to traditional forklift trucks. This allows increased efficiency and speed when moving, loading and unloading in narrow aisles. Dangerous internal combustion emissions are eliminated due to their electrical power use, making side loaders excellent for interior applications. Internal Combustion Engine Side Loader Forklifts The Class 2 forklifts only apply to side loaders that use electric power. Units that do not rely on electricity do not fall into this category. Side loaders are found in timber and lumber yards and pipe and steel yards for transporting long and heavy loads. They can move items from flatbed trucks, stack items in blocks or racking. Exterior side loaders need to work outside and on uneven surfaces. Internal combustion models are common. These units rely on pneumatic tires for better transportation. Side loaders can efficiently load cumbersome items that are long and heavy by securing them in the middle. Side Loader Forklift Design The side loader forklift has two kinds of designs, sit down models or stand on models. Stand On Side Loader Forklifts Stand-on side loaders are often seen in interior locations. It consists of a platform area that is surrounded by controls and usually found in the middle of the machine. There are many advantages to the stand-on design. It creates a more compact machine and smaller cab design since there is no seat for the operator. This creates a forklift with a smaller footprint which is advantageous for traveling within confined locations. There is better visibility for the operator when working in a standing position, particularly while operating the machine backward. While standing, the operator can turn their body to see the back of the forklift truck while in reverse. In a sit-down machine, operators need to twist their neck and back to get a clear view. There are more safety and operator comfort in the stand-up side loaders, ensuring better visibility and less potential for damage or injury. Operators on standing forklifts can enter and exit the machine faster than sit-down cab units. Sit Down Side Loader Forklifts Sit-down loaders are more popular than standing loaders. Similar to the side loader stand, the sit-down unit features a centrally located cab. Sit-down forklifts have a raised platform and a seat that faces the control panel of the machine. The

advantages of a sit down side loader are mostly in operator comfort. The machine enhances productivity and reduces fatigue when operators can work from a resting position. Customizable Features Customizable bed lengths are a feature and benefit of side loader forklifts. The standard bed length for a side loader was designed to fit a variety of bulky and heavy loads but this can be extended upwards of 60 inches to meet custom jobsite applications. However, when customizing a side loader feature such as the bed length, consideration must be given to the width of aisles at the relevant jobsite as guide rails and aisles may need adjusting to accommodate the extra sized forklift, which is likely to affect budget and productivity. These machines can function in a multidirectional manner. Crab steering on side loaders refers to having two wheels function independently from the other wheels. Crab steering allows the unit to travel in all four directions by changing the direction of the wheels. The side loader can fit into close quarters and narrow spaces without needing to make huge turns or adjustments. The smaller turning radius increases safety while decreasing damage to product and facilities. It also increases efficiency by lessening the time and space needed to maneuver around the job site. Several other features on side loader forklifts are often customized based on jobsite application. Tine length, mirrors, lights, lift mast heights and lift capacities are some of the custom options available. Certain features are also adjustable, allowing for further customization of the side loader for the particular job application. Travel speed, acceleration time, load limits and breaking force can all be set allowing further job efficiency and increased workplace safety. For all of the above reason, the side loader forklift has become the most popular option for workplaces where space is limited and long loads are involved.
